Kaspersky Protects Company Data with Anti-Virus Protection for Storage Solutions

In complex, multi-platform networks, a single virus can spread very quickly as it is virtually impossible to isolate a newly detected network infection immediately. Corporate users often place various files into file storage systems, thus exposing all nodes from workstations to shared file storage facilities. on the corporate network to risk.

Kaspersky Lab has developed a dedicated solution to protect EMC Celerra storage systems. The product is fully compatible with the latest versions of Cellerra anti-virus agent, an application developed by EMC that runs on a Windows Server allowing KAV for Storage to scan the CIFS files stored on a Cellerra Network Server, providing an unprecedented high level of security. It detects and removes all types of malware from files and archives stored on EMC Celerra storage products. All data is scanned on-the-fly as it is being written to storage or while it is being modified.

Product Features

- Always-on anti-virus protection.
- Proactive protection from malware
- Backup copying
- Flexible scan settings
- Rigid security, flexible configurations

Advantages

- A new, high performance anti-virus Engine ensures maximum performance
- Real-time protection protecting file storage
- Reliability built in with automatic restarts
- User-friendly management makes installation and management fast and easy
- Regular updates ensuring continuous protection and saving time
- Support for Windows Server 2008 R2

Administration

- Can be managed either directly or remotely via the Microsoft Management Console, the Kaspersky Administration Kit, or by using the command line
- Centralized installation and management
- Control over administrator privileges levels
- Supports administrator notifications via the messaging service or email
- Integrated with Simple Network Management Protocol (SNMP) and can operate with Microsoft Operations Management (MOM).
- Flexible reporting system with integrated search tool
